

Technology Stack

Date	02 October 2026
Team ID	6aba2e98ca93a2750963fe65
Project Name	PocketSmart AI - Your Smart Budget & Recommendation Assistant
Maximum Marks	

Define Your Technology Stack:

Identify the programming languages, frameworks, databases, front-end tools, back-end tools, and APIs that you will use to build your solution. A well-chosen technology stack ensures that your application is scalable, maintainable, and aligned with your project requirements.

Fill out the table below to detail the specific technologies chosen for each component of your architecture and provide a brief justification for your choice.

Technology Stack Details

1	Frontend / Client-Side	HTML/CSS/JavaScript + Jinja2	Provides the web interface for login, dashboard, and Home, Party, and Jewelry planner pages. Jinja2 renders server-side HTML templates.

2	Backend / Server-Side	Python, FastAPI	Handles routes, input validation, authentication, sessions, planner APIs, and application logic.
3	Database / Data Storage	SQLite, Python sqlite3	Stores user information and recommendation history for logged-in users and planner reuse.
4	Cloud / Hosting / Deployment	Uvicorn (development server)	Runs the FastAPI application locally for development and demonstration using the documented Uvicorn command.
5	Version Control & CI/CD	Git, GitHub	Supports source-code version control and team collaboration through the project repository. CI/CD is not specified in the project documentation.

6	Third-Party APIs / Other Tools	Google Gemini API	Provides Generative AI for budget-aware recommendations for Home, Party, and Jewelry planners, including optional outfit-image analysis for the Jewelry Planner.
